Control of Dead-time Processes (Advanced Textbooks in Control and Signal Processing) Julio E. Normey-Rico

This text introduces the fundamental techniques for controlling dead-time processes from simple monovariate to complex multivariate cases. Dead-time-process-control problems are studied using classical proportional-integral-differential (PID) control for the simpler examples and dead-time-compensator (DTC) and model predictive control (MPC) methods for progressively more complex ones. Downloadable MATLAB® code makes the examples and ideas more convenient and simpler.
